

NETFLIX CONTENT ANALYSIS

SUMMARY

This project focuses on analyzing streaming platform data to understand viewer behavior, content performance, and audience engagement across multiple dimensions. The process began with data cleaning and preparation to ensure data accuracy, consistency, and proper formatting. Analytical measures and calculations were created to evaluate key metrics such as watch time, ratings, customer engagement, subscription preferences, and content popularity.

The dataset was analyzed across dimensions including genre, content type, country, subscription type, release year, and audience demographics to identify meaningful viewing patterns and performance trends. Multiple interactive visualizations were designed to present insights clearly, supported by filters, slicers, and dynamic analytical measures. To enhance user experience and dashboard interactivity, buttons, page navigation, and bookmarks were implemented for seamless report navigation and storytelling. Finally, a multi-page interactive dashboard was developed to monitor key performance indicators, audience preferences, and content trends for data-driven analysis.
